Human Resources Intermediate Query 9.1

Creating and Formatting a New Query

Create A New Query

Procedure

In this topic you will learn how to create a new query.

In this example the query will display the employee's **name**, **emplid**, **department**, **original hire date**, and **highest education level**.

Step	Action
1.	Click the Main Menu button. Main Menu
2.	Point to the Reporting Tools menu.
3.	Point to the Query menu.

Search Menu: Searc
Self Service > Manager Self Service > Workforce Administration > Benefits > Toropensation > Payrol for North America > Payrol Interface > Workforce Development > Organizational Development > Organizational Development >
VOLNOE VALUE HANS A Reporting Tools PeopoleTools LSUHSC Processes My Personalizations

Step	Action
4.	Click the Query Manager menu.
	Query Manager

Step	Action
5.	Click the Create New Query link.
6.	Adding Records:
	The Records page is the first page that you will see when you click the Create New Query link on the Search page.
	You will select the information for your query on the Records page.
7.	The Records page displays the records (tables) available to query in alphabetical order. The list of records available to the end-user is determined by his/her security rights (Operator ID).
	The end-user may view existing records by selecting one of the following methods:
	1. Click the Search button to view a list of records; or
	2. Enter the appropriate search criteria (record name) into the Search by field. The end-user may enter the full record name or partial information in CAPS or lower case. Use the % (percent sign) to act as a wildcard when searching.
8.	In this example you will use fields from one record the EMPLOYEES record.
	In order to find the record enter "employees" into the begins with field.

Action
Click the Search button.

Format A Query

Procedure

In this topic you will learn how to format the query results to change the display. This is accomplished on the Fields page. The following are the format options available:

- · Change the column heading text.
- \cdot Sort the output results by a particular field.
- · Change the order of the columns (i.e. the order in which the fields appear in the query results).
- \cdot Change the translate code when this option is available for a field.

In this example the query results will be formatted as follows:

- · Change the heading text to reflect the long description for Highest Education Level.
- · Sort the data by Highest Education Level in descending order.
- Change the order of the Highest Education Level field to display as the first column.

· Display the long description of each person's Highest Education Level

rather than the default code.

		es <u>F</u>	Publish	as Fe								

Step	Action
1.	Click the Edit button for the Highest Education Level field.
	Note: Fields are formatted one at a time.

Step	Action
2.	In the Heading box: • The RFT Short option will display the default selection (Hi Educ Lv) in the column heading. • The RFT Long option will display the long description (Highest Education Level) in the column heading.
	• The Heading Text option will display the free text (that you type) in the column heading.

	© Expression Add Prompt Add Field	
	Main	Content

Step	Action
3.	Enter the desired information into the Heading Text field. Enter " Highest Education Level ".
4.	The Translate Value box will not appear on this page if a field does not have an associated Translate Value.
	 If a field has an associated Translate Value, the XLT column will contain one of the following three values: N (None) option will display the default translate code (e.g. "G" for a Bachelor's Degree) in the query results. S (Short) option will display a maximum of 10 characters (e.g. Bachelor's) in the query results. L (Long) option will display a maximum of 30 characters (e.g. G-Bachelor's Level Degree) in the query results.

Step	Action
5.	For Translate Value , click the Long option to allow the full description of each person's highest education level to display (instead of abbreviation code).
6.	Click the OK button.
7.	You can see on the Fields page the changes you made to the field properties for HIGHEST_EDUC_LVL .

Step	Action
18.	Using the Distinct Option:
	Note: When running a query, occasionally the same row of output may be listed more than once when it meets multiple query requirements. Using the Distinct option removes duplicate rows of data. However, the end-user should note that this option may remove pertinent duplicate information , depending on the query. Therefore, if the end-user is not sure if any pertinent data will be removed by selecting this option, the safer alternative would be to run the query results to Excel and manipulate the data in the spreadsheet.
	If the end-user is confident that pertinent data will not be removed, the Distinct option is located in the Query Properties box.
	Click the Properties link. <u>Properties</u>

Working with Criteria and Prompts

When you build a query you may wish to add certain criteria to limit the query results to a particular condition (e.g. a specific value, a list of values or between two specified values). Although, there are several conditions which you may select, the three most used Condition Types will be covered in Query Intermediate (i.e. equal to, in list and between).

Add a Single Criteria

Procedure

In this topic you learn how to add a single criteria to the query in order to limit the query results to a specified value.

In this example the query will display the employees whose highest education level is **Doctorate** (Academic). To do this you will use the "equal to" Condition Type.

Using Between Criteria

Procedure

In this topic you learn how to add a criteria to the query in order to limit the query results to data that falls between two specified values.

In this example the query will display the employees whose original hire date is between January 1, 2004 and July 31, 2004. To do this you will use the **"between"** Condition Type.

Creating a Prompt for Criteria

Procedure

In this topic you learn how to add a prompt to the query which will allow you to select a desired value each time the query is run.

In this example, when you run the query you will be prompted to select the desired highest education level. To do this you will use the **"equal to**" Condition Type and create a **"prompt"** expression.

Hi Educ Lv:			
OK Cancel			

Step	Action			
8.	You are prompted to select the desired highest education level. Click the Hi Educ Ly list.			
9.	Click the Medical Doctor list item. Medical Doctor			
10.	Click the OK button.			
11.	Note: The query results display those employees whose highest education level is Medical Doctor .			
	Note: You Save your changes before selecting another link from the menu (e.g. Reporting Tools) by clicking the Save or Save As button . <u><i>There is no Warning that changes will be lost.</i></u>			
12.	This completes <i>Creating a Prompt for Criteria</i> . End of Procedure.			

Using Multiple Tables in a Query

When creating a query, it may be necessary to retrieve data from more than one table (record) or specify criteria in your query from a second table. In these cases, you need to link at least two tables in one query. Query enables you to run a query that pulls information from multiple tables. When you perform a join, the records involved are linked based on common fields.

Linking multiple tables, or joining, enables Query to retrieve data from more than one table, but the query output will appear as if the data is retrieved from a single table. Working with multiple tables is almost as easy as working with one.

The three joins that are covered in Query Intermediate are the following:

- 1. Record Hierarchy join
- 2. Related Record join
- 3. Any join

In this lesson you wish to retrieve a query that provides a list of employees with their **EmplID**, **Job Code**, **DeptID**, **Name and Job Title (Descr**). The **Personal_Data** record contains the **EmplID** and *Name* fields. The **Job** record contains the **Job Code** and **DeptID fields**, but not the **Descr field**. The **Descr** field is found in the **Jobcode** table. Therefore, it will be necessary to pull the fields from three different tables (**Personal_Data**, **Job** and **Jobcode**) to retrieve the desired query results.

Any Joins and Related Record Joins

Procedure

In this topic you will learn how to create a query that combines fields from three tables/records (**Personal_Data, Job and Jobcode**) using the two predefined joins **Record Hierarchy** join and a **Related Record** join.

In Query, predefined joins can be generated as a Related Record join. Since these types of joins are predefined, you will not have to add any criteria to manually link the records.

Any Joins gives you the ability to join any record to your currently selected record. Records will be joined on their common high-level keys. If you have an **Any Join**, it will automatically be added to your criteria, unless there is only one row of data in the record to be joined.

Step	Action
1.	Click the Main Menu button. Main Menu
2.	Point to the Reporting Tools menu.
3.	Point to the Query menu.

eady								Count: 7 🔛 🔲	100% 😑 🗕	

Step	Action
4.	Notice the each column displays a drop-down button.
	Click the button to the right of the birth date field.
5.	Click the checkbox to the left of the Select All option to deselect it.
6.	Click the 1993 option.
7.	Click the OK button.
8.	A list of employees who were born in 1993 displays. The filter symbol displays next to the column header to denote that filtering has occurred.
9.	This completes Auto Filter . End of Procedure.

Delete Columns

Procedure

In this topic you will learn how to **Delete Columns**.

Step	Action
1.	The redefined queries in PeopleSoft 9.1 are very general, therefore, there is information included that is not needed by all users. After running your report you can delete any unrelated columns in Excel.

7.	This completes Delete Columns . End of Procedure.

Resize Columns

Procedure

In this topic you will learn how to **Resize Columns**.

Step	Action
1.	There are two options available for resizing columns:
	 Manually enter the appropriate column width, or Utilize the Excel - Auto Fit option.
	In this example both options will be demonstrated.

Starl	t 🙆					★ ①) 5:59 PM 4/20/11

Step	Action
1.	In this example you will find employee names that contain "John".
	Click the Find & Select button.
2.	Click the Find option.
	<u>F</u> ind
3.	Enter the desired information into the Find what: field. Enter " John ".
4.	Click the Find Next button.
	<u>Find Next</u>
5.	The system will take you to the first name containing "John". In this example the
	system will not differentiate between first names and last names containing "John".
	You will click the Find Next button to search for the next employee name.
б.	This completes Find .
	End of Procedure.

Sort Using Multiple Criteria

Procedure

In this lesson you will learn how to Sort Using Multiple Criteria.
